

# Demo — AP 3-Way Match Agent

---

Run a 3-way match on the attached purchase order, goods receipt, and invoice. Apply the matching policy.

HTML

Case **1** - Clean match

Attach: PO-1001, GRN-5001, INV-9001

Prompt:

Run a **3-way** match on the attached purchase order, goods receipt, and invoice. Apply the matching policy.

Response:

Verdict: MATCHED - approve for payment: \$1,708.00 Recommended action: release to AP; no exceptions.

Every line matches across all three documents - supplier, PO reference, item codes, quantities, and unit prices all agree, and each line amount recomputes within tolerance. Price checks pass, quantity checks pass (billed = received), totals reconcile.

Reason: PO, receipt, and invoice agree within policy tolerance on all lines.

Narrate: "This is the happy path - the agent clears it in seconds and it's ready to pay. In production this one auto-approves and never touches a human."

---

HTML

Case **2** - Price variance

Attach: PO-1002, GRN-5002, INV-9002

Prompt:

Run a **3-way** match on the attached purchase order, goods receipt, and invoice. Apply the matching policy.

Expected response:

Verdict: EXCEPTION (price) - block affected line, route to buyer Recommended action: hold the affected line for buyer price approval; approve the remaining lines.

Narrate: "The receipt was fine, but the vendor billed a higher unit price than we agreed. The agent caught the overcharge, quantified it, and is routing just that line - not the whole invoice - to the buyer."

| Check      | PO    | Invoice | Variance | Results                     |
|------------|-------|---------|----------|-----------------------------|
| Unit Price | \$3.5 | \$3.85  | +10.0%   | FAIL – exceeds ±2% / \$0.05 |

*Reason: invoice unit price is 10% above the PO – over the price tolerance.*

#### HTML

Case 3 – Short receipt

Attach: PO-1003, GRN-5003, INV-9003

Prompt:

Run a 3-way match on the attached purchase order, goods receipt, and invoice.  
Apply the matching policy.

Expected response:

Verdict: EXCEPTION (quantity / short receipt) – part-pay, hold remainder

Recommended action: approve the received quantity; hold the balance until the backorder is received.

| Item               | Billed   | Received | Approved to pay | Held Quantity |
|--------------------|----------|----------|-----------------|---------------|
| 500                |          |          |                 |               |
| 460                |          |          |                 |               |
| 460 × \$0.40 =     | \$184.00 |          |                 |               |
| 40 units (\$16.00) |          |          |                 |               |

Prices are correct; the only issue is that the invoice bills more than was received.

Reason: billed quantity exceeds goods-receipt quantity – pay only what arrived.

Narrate: "We were billed for 500 but only 460 showed up. Rather than block the whole payment, the agent pays for exactly what we received and parks the rest until the backorder lands."

#### HTML

Case 4 – Missing receipt

Attach: PO-1004, INV-9004 (no goods receipt – by design)

Prompt:

Run a 3-way match on the attached purchase order, goods receipt, and invoice.  
Apply the matching policy.

Expected response:

Verdict: HOLD – required document missing Recommended action: park the invoice; request the goods receipt (GRN); re-run when it arrives.

No goods receipt was supplied, so delivery cannot be confirmed. The agent will not approve payment for goods it can't prove were received.

Reason: a three-way match can't be completed without proof of receipt.

Narrate: "No proof of delivery, no payment. This is the control that stops us paying for goods that never arrived."

---

## The policy is editable, no rebuild

This is the point that lands with business leaders: **a business user changes the control by editing a document, not by touching the agent.**

1. Open the knowledge doc [3-way-matching-policy.pdf](#) and widen the **price tolerance from  $\pm 2\%$  to 15%**.
2. Re-run **Case 2** with the same prompt and the same three files.

**Expected response now:**

**Verdict: MATCHED** — the +10% line (\$3.85 vs \$3.50) now falls inside the new 15% tolerance, so it passes.

**Narrate:** "Nothing about the agent changed — no code, no redeploy. The rule lives in a policy document the business owns, and the behavior changed the moment the policy did."

*(Reset the tolerance back to  $\pm 2\%$  afterward so the demo is repeatable.)*
